Oil Mist Eliminators For Power Stations

Suitable for all gas turbines, steam turbines, gas engines and diesel engines
Large volumes of lubricating oil are required to cool and protect the internal surfaces of engines, gearboxes and turbines. These conditions result in the generation of oil mist, which traditionally was vented to atmosphere. However, this may now not meet increasingly stringent environmental legislation.

Failure to deal with oil mist can at worst represent a significant environmental hazard and at best will attract dust and dirt making the site an unpleasant place to work.

VOKES' oil mist eliminator systems have been designed to remove all visible oil mist.

What is oil mist?

Oil within an engine is subjected to high temperatures and pressures during operation, which can result in the creation of oil mist. In diesel engines this is compounded by compressed, burnt gases passing by the piston rings to pressurise the crankcase.

The mist typically consists of oil droplets ranging in size from 10µm down to 0.03µm and when vented into the atmosphere is normally visible as blue-white smoke.

Generally some of this mist can be arrested using interceptor wire mesh, but this only catches the large droplets.

Oil mist then settles and deposits itself on surrounding surfaces - resulting in an oily film on machinery and buildings which attracts dust and is unpleasant and potentially dangerous.

In addition, the oil mist can be explosive if allowed to form unchecked.

VOKES has researched the factors influencing oil mist emissions with the aim of satisfying ever tightening environmental legislation that frequently refers to 'no visible emissions'.

How do oil mist eliminators work?

VOKES Oil Mist Eliminators cartridges remove entrained oil by a coalescing process. The cartridge contains an oleophilic (oil attracting) media which is designed to maximise oil removal while minimising differential pressure.

Droplet formation and breakthrough

The contaminated air stream is directed through specially developed VOKES cartridges, which consist of multiple layers of dense coalescing media. The oil attracting characteristics of the media ensure that oil droplets passing through the cartridge are attracted to the fine fibres. The depth of media ensures that each oil droplet will find a fibre, even though the space between the fibres may be larger than the diameter of the oil droplet itself. Further droplets attach themselves to the fibres, joining together to form larger droplets with the continued removal of oil from the airstream. Eventually, either due to the force of gravity or the velocity of the air stream, these larger droplets break away, drain through the coalescer and eventually accumulate as free oil at the bottom of the eliminator.

Cartridge saturation and equilibrium

During operation oil mist eliminator cartridges reach a state of saturation or equilibrium. This is the point at which the rate of oil removed from the air stream equals the rate at which it is drained away. Saturation is the normal operating condition and will continue until the cartridge is blocked by particulate contaminants released by the machine into the oil mist stream.

VOKES Oil Mist Eliminators

Efficient operation and cost savings

The operating efficiency of turbines is reduced when oil mist is sucked back into the air intakes. This can block the air filters and coat the internal surfaces with oil. VOKES oil mist eliminators improve the air quality in the vicinity of the air intake, which in turn helps to maintain power output and reduces the frequency of air filter replacement as a result of oil fouling.

Thousands of litres of oil can be lost from an installation over a period of a year due to oil mist emissions. The cost of replacing expensive turbine oil can be greatly reduced by returning the recovered oil back to the system.

VOKES oil mist eliminators help to reduce general maintenance costs by recovering oil, which would otherwise cause unsightly staining in the turbine area.

Selecting VOKES oil mist eliminators reduces the capital cost of an installation by minimising the need for complex venting and pipework installations.

The use of Oil Mist Eliminators can also represent a major cost saving. A gas turbine venting 2000m³/h with an oil mist concentration of 100ppm will lose nearly 3000 litres of oil to the atmosphere a year. VOKES Oil Mist Eliminators capture and return this oil to the sump and so pay for themselves in a very short time.

VOKES fan assisted oil mist eliminators compensate for the differential pressure across the oil mist eliminator cartridge and can create a small depression within the machine if required. This eliminates unwanted pressurisation of the lubricating oil system itself. Fan assisted units are typically utilised for gas turbine lubricating systems and diesel engine crankcase breather applications.

VOKES naturally vented oil mist eliminators are suitable for retrofit applications where fan assistance is already provided, or more unusually, where machines can operate with a positive back pressure.
**APB Technology**

Eliminating the need for operator intervention

During start up and shut down, system airflow may vary dramatically. APB Technology is designed to ensure a constant and safe system by continually sensing the pressure and varying the oil mist eliminator ventilation to match. This ensures that the pressure remains constant, without the need for adjustment by operators. This system is particularly useful where power plants are subjected to frequent intermittent operation such as would be the case with ‘peak lopping’ stations.

Interfacing with the system can be completely automatic or set and modified by the monitoring staff. An electronic, menu-driven pad provides immediate access for maintenance. This can also be electronically locked through passwords to prevent tampering.

The sizing of VOKES Oil Mist Eliminators is based on the airflow through the module. The required airflow for an application can be calculated by measuring the air velocity through a tube of known diameter exiting from the outlet to which the Oil Mist Eliminator is to be connected. For advice and assistance in selection and specification, please contact VOKES.

### Vokes Product Range

As well as oil mist eliminators, Vokes can also supply a range of fuel & lubricating oil filters, as well as oil/water coalescers. This in addition to the Vokes Stream-Line range of insulating oil conditioning plant.
